MINILOAD

The Miniload automated storage system is the optimal solution for light and small unit loads with high stock turnover ratios. This system is handled using ASRS. It is a high-density system as a result of a reduction of operating aisles, and maximised floor and height space.

Response times are reduced and productivity is increased by using ASRS of varying types and operation based on the unit load to be handled. Reliability facilitates daily inventory of stored products and minimises errors when handling unit loads.
